IMPLEMENT CLIENT SCRIPT & UI POLICY IN SERVICENOW

Project Planning and Development Document (PPD)

1. Brainstorming & Ideation Phase

In this phase, we identify the project idea and discuss how to improve form functionality in ServiceNow.

The main idea of this project is to implement Client Scripts and UI Policies to make forms more interactive and user-friendly.

Key Activities:

- Identify the problems in existing ServiceNow forms.
- Discuss the uses of Client Scripts and UI Policies.
- Identify the fields that require automatic actions.
- Decide how to make forms easier to use.
- Finalize the project concept.

Outcome: A clear project idea is developed to improve ServiceNow form behavior.

2. Requirement Analysis Phase

In this phase, we analyze the requirements needed to implement Client Scripts and UI Policies.

Functional Requirements:

- Display or hide fields based on conditions.
- Make fields mandatory when required.
- Make fields read-only when necessary.
- Display alerts and validation messages.
- Automatically change field values based on user actions.

Technical Requirements:

- ServiceNow instance with appropriate access.
- Basic knowledge of ServiceNow forms.
- Knowledge of JavaScript.
- Understanding of Client Scripts and UI Policies.

Outcome: All functional and technical requirements are identified.

3. Project Design Phase

In this phase, we design the form and decide how Client Scripts and UI Policies will work.

Client Script Design:

- Use an onLoad Client Script to execute logic when a form loads.
- Use an onChange Client Script to respond to field changes.
- Use an onSubmit Client Script to validate data before submission.

UI Policy Design:

- Create conditions to control form fields.
- Make fields mandatory when a specific condition is satisfied.
- Make fields read-only or hide fields when necessary.
- Use UI Policy Actions to define field behavior.

Example: In an Incident form, when the Priority field is set to Critical, the system can display a message or make a selected field mandatory.

Outcome: The form design, conditions, and required actions are finalized.

4. Project Planning Phase

In this phase, we prepare a plan for implementing the project.

Planning Activities:

- Divide the project into smaller tasks.
- Prepare the implementation schedule.
- Identify the required ServiceNow modules and fields.
- Assign responsibilities to team members, if applicable.
- Plan testing and documentation activities.

Project Schedule:

Activity| Estimated Duration
Brainstorming and ideation| 1 day
Requirement analysis| 1 day
Project design| 1 day
Project planning| 1 day

Project development| 2 days
Project testing| 1 day
Project documentation| 1 day
Project demonstration| 1 day

Outcome: A clear implementation schedule and task plan are prepared.

5. Project Development Phase

In this phase, we implement Client Scripts and UI Policies in ServiceNow.

Step 1: Open the Incident Form

Log in to ServiceNow and open the Incident module.

Step 2: Create a Client Script

Navigate to the Client Scripts section and create a new Client Script.

- Enter the script name.
- Select the table as Incident.
- Choose the appropriate script type, such as onLoad, onChange, or onSubmit.
- Write the required JavaScript code.
- Save the Client Script.

Step 3: Create a UI Policy

Navigate to the UI Policies section and create a new UI Policy.

- Select the Incident table.
- Define the required condition.
- Configure the UI Policy Actions.
- Set the field to mandatory, read-only, or visible as required.
- Save the UI Policy.

Step 4: Configure the Conditions

Configure the conditions according to the project requirements.

For example, when the Incident Category is Hardware, a related field can be made mandatory using a UI Policy.

Step 5: Implement and Save

Save all configurations and verify that the Client Script and UI Policy are active.

Outcome: Client Scripts and UI Policies are successfully configured in the ServiceNow Incident form.

6. Project Testing Phase

In this phase, we test the implemented features to ensure that they work correctly.

Testing Activities:

- Test the form when it loads.
- Change field values and verify the expected actions.
- Check mandatory field validation.
- Verify that read-only fields cannot be edited.
- Confirm that fields are displayed or hidden correctly.
- Test form submission with valid and invalid data.

Sample Test Cases:

Test Case| Expected Result
Open the Incident form| The form loads correctly
Select the specified category| The related field becomes mandatory
Change the configured field value| The required client-side action occurs
Submit the form without a required value| Validation prevents submission when applicable
Change the condition to false| The UI Policy applies the configured reverse action, if enabled

Outcome: The implemented functionality is verified, and identified errors are corrected.

7. Project Documentation Phase

In this phase, we prepare complete documentation of the project.

Documentation Includes:

- Project title and introduction.
- Project objectives.
- Requirement analysis.
- Project design and workflow.
- Client Script configuration details.

- UI Policy configuration details.
- Screenshots of implementation.
- Testing procedures and results.
- Conclusion and future enhancements.

Outcome: A complete project document is prepared for submission and reference.

8. Project Demonstration Phase

In this final phase, we demonstrate the working project to the faculty or evaluator.

Demonstration Steps:

1. Introduce the project and its objectives.
2. Log in to the ServiceNow instance.
3. Open the Incident form.
4. Demonstrate the Client Script functionality.
5. Demonstrate the UI Policy functionality.
6. Show the mandatory, read-only, or visibility changes.
7. Perform the test cases.
8. Explain the results and conclusion.

Expected Demonstration Result: The evaluator can observe how Client Scripts and UI Policies control form behavior and improve the user experience.

PROJECT CONCLUSION

The project successfully demonstrates the implementation of Client Scripts and UI Policies in ServiceNow. Client Scripts help execute client-side JavaScript logic, while UI Policies control form field behavior based on specified conditions.

This project improves form usability, supports data validation, reduces manual effort, and provides a better user experience. It also provides practical knowledge of ServiceNow administration and form customization.

FUTURE ENHANCEMENTS

- Implement additional form validation rules.
- Create more dynamic form behaviors.
- Improve user-friendly error messages.
- Extend the implementation to other ServiceNow tables.
- Integrate additional automation features where required.
